Control Group Consortium Team Statement

Team members Amber Liu, Nicole Wang, Camille Cai, Eloise Chen

We share an understanding of the project goal: to produce a consistent ERD and schema design for the Control Group Consortium scenario, with its business rules and assumptions represented clearly. The first four design checklist items are complete. This statement records our shared plan for the remaining normalization review, repository setup, and final submission.

Completed work and primary ownership

All four members discussed and agreed on the ERD framework, scenario, business rules, and assumptions. Amber created the initial ERD framework. Nicole, Camille, and Eloise then worked together to refine relationships, cardinality, and optionality and to consolidate the design document. The ownership below gives each person a clear lead responsibility while keeping key design decisions and final review shared across the team.

Member	Primary ownership	Related output
Amber	Initial ERD and diagram integration	Entity layout, initial connections, and one consolidated ERD version.
Nicole	Relationship mapping and labels	Relationship direction, foreign-key mapping, and relationship-list review.
Camille	Cardinality, bridge tables, and normalization	One-to-many and many-to-many cardinality, bridge tables, and 3NF review.
Eloise	Optionality and document consolidation	Required or nullable relationships, constraint wording, and Word document integration.

Equitable workload and mutual support

We assigned lead roles by work area so that responsibilities are clear and connected to each member's contribution: Amber coordinates the ERD and repository, Nicole checks relationship and foreign-key mapping, Camille leads bridge-table and 3NF review, and Eloise checks

optionality and document consistency. We will compare the expected effort and deadlines for these tasks, not just count the number of tasks. If a task takes substantially longer than expected or one member has less capacity, we will redistribute work by agreement and record the change in the shared task list. Each lead remains responsible for their section, while all four members review the final design together.

Repository organization and remaining work
Eloise set up the shared github repository. All four members agree on model choices, and then update both the ERD and Word document.

Team Member	Remaining Task
Amber	Create the repository structure, integrate ERD revisions, and export the final PDF.
Nicole	Check relationship labels, the relationship list, and foreign-key mappings; apply the listed name corrections.
Camille	Review bridge tables and 3NF notes; synchronize the design document
Eloise	Check optionality, constraint wording, and the credential-field decision; update the design document and checklist.

Before submission, all four members will take part in the checking process. Amber will update the ERD, Camile will synchronize the design document, and Nicole and Eloise will review relationships and cardinality. We will use an agreed to-do list to report progress, and keep decisions and revisions visible to everyone in the shared doc. Members will review one another's work constructively and offer help when someone is stuck or overloaded, changes to ownership will be agreed by the team and recorded.

We will prevent an uneven workload by carefully assigning the work to each person and check with the progress continuously throughout. If an assignment becomes too large, we will split it or reassign part of it before the deadline is at risk. If there are any difficulties, the team will help, and all four members will confirm the final files before submission.
